Cure for Cancers

Turkey Figs boiled in raw milk
 when the figs become tender split them
 and apply as a poultice as warm as can
 be borne - when the poultice is changed wash the
 part with the milk the figs are boiled in -
 apply three a day - a $\frac{1}{4}$ pt of the milk the figs have
 been boiled in to be drunk twice a day - persevere for
 3 or 4 months -

reduce the time to days, multiply by the full amt. of money & divide by
 6,000 - is also an easy & correct way of calculating interest.

To Calculate Interest

on \$500 - for 2. 6. 13 -
 yrs mo. days

reduce year to mos & divide the days by 3 -

making 30. 1^{mo} day -

Take $\frac{1}{2}$ amt of money - $\frac{250}{150 \ 50}$
 $60 \ 2$

\$75. 2 50 Interest

Grape Wine

1 Gall Grape Juice
 3 lbs Sugar

ferment with 6 clarks
 decant & bottle

Black Berry Wine (Lute)

20 lbs Berries
 20 " Water boiling
 First wash the berries thoroughly
 then pour over the boiling water & let
 stand for 24 hrs then press & strain
 into a keg (add $\frac{1}{2}$ pt of brown sugar
 to each gp of berries) fill the keg & let it
 work over full up the top, which it has
 working being tightly stoppered each day for 4 days
 then bottle & cork.

Mr S Mansfield

Dear Sir:

The infusion
is composed as follows

Digitalis $\mathfrak{z}\text{ss}$

China Cort Reg $\mathfrak{z}\text{vj}$

Aqua focr $\mathfrak{z}\text{xx}$

Part Borax $\mathfrak{z}\text{ij}$

Sydenhami Laudanum $\mathfrak{z}\text{ij}$

The formula calls for that this
infusion should be kept for $\frac{3}{4}$ hour
& then be filtered. Hoping this
will clear up all obstacles

Respectfully

J. H. H.

UNG. HYDRARGYRI NITRATIS.

BY JAMES R. NICHOLS.

THERE are but few medicinal agents held in higher esteem by the profession than the ung. hydrargyri nitratis.

It would doubtless be much oftener employed if a uniformly good article could be obtained of the dispensary druggists, or could physicians easily and successfully prepare it themselves. The last edition of the U. S. Pharmacopœia orders neats-foot oil in its fabrication, instead of olive oil, as formerly directed. This substitution is certainly unfortunate, as the resulting ointment is usually less satisfactory than that prepared from the materials formerly employed. The cause of failure is owing mainly to the fact that it is almost impossible to procure in the market true neats-foot oil, and the article used is bad. No variety is so uniformly adulterated as this. Indeed, that which is offered by dealers, is often entirely factitious. It is a semi-fluid compound, made up of pea-nut oil, fish oil, rancid lard, with tallow, and possessing a most disgusting odor. The true oil has, indeed, a peculiarly unpleasant smell, which it communicates to the ointment, and renders it unfit for use.

Various substitutes have been proposed in the medical and pharmaceutical journals, among which have been linseed, pea-nut, and even bear's oil; but none of them furnish quite satisfactory results. After experimenting with a great variety of oleaginous substances with the view of improving the formula, I have been led to adopt fresh butter and lard, as furnishing the most desirable preparation. The formula is as follows:—Pure mercury, 1 oz.; nitric acid (sp. grav. 1.40), 14 fluidrams; fresh butter, 6 oz.; lard, 6 oz. Dissolve the mercury in the acid, under slight heat, and stir with a glass rod until the nitrous fumes have escaped. Mix the butter and lard together, elevate the temperature to 120 deg. Fahr. and pour in the acid solution. Perfect reaction will occur in the course of a few hours, the mass will puff up, evolving nitrous vapors freely. It should be stirred occasionally with a wooden or porcelain spatula. When cool, the result will be a very perfect golden-colored ointment, of the right consistency, which will remain unchanged for many months.

The butter should be of the best quality, and, if salted, must be kneaded in tepid water until all the saline particles are removed. The mercury should be free from tin and other impurities. If large quantities are prepared, the reaction is sufficiently rapid and perfect when the temperature remains at 100° Fahr. I have found that equal parts of butter and lard make a much finer ointment than butter or lard alone. The adoption of the above formula leaves little to be desired in the preparation of this useful ointment.

apparatus, and employing delicate chemical tests, in rooms the walls of which were covered with these arsenical papers, no evidence of the presence of the poison in the atmosphere has been afforded; and this corresponds with the results of all similar experiments made in this country and in Europe, so far as my knowledge extends. We must conclude that agents not recognizable by chemical tests are capable of disturbing vital processes. The evidence is very clear that in instances of illness confined to one or two members of a household, the cause may be due to some accidental disturbance with which all are equally brought in contact, but which has not the power of injuriously influencing but a part. It is also clear that these sources of disease are of such a character as easily to escape detection, and therefore any facts or experience which may serve as guides to their discovery, are worthy of record.

From the Boston Medical and Surgical Journal, January, 1862.

EXTRACT OF FLESH FOR ARMY USES.

BY JAMES R. NICHOLS.

NOT having seen any allusion in the reports or statements of the Army Surgeons, or the Sanitary Commissioners, respecting the dried Extract of Flesh, I infer that attention has not been called to this important article for army purposes. It is a nourishing, easily assimilated food, in the most concentrated form. Enough can be stored in an ordinary watch-fob to sustain a soldier a week. It might, however, be regarded as too expensive for ordinary use, but in the hospitals, and on the battlefield, it would be almost criminal to fail to supply it, if the experience of military surgeons agrees with that of many eminent chemists and physicians. Parmentier, in the *Annales de Chimie et de Physique*, Vol. XVIII., p. 177, thus speaks of it:—"The dried extract of flesh, as an article of provision in the train of a body of troops, supplies to severely-wounded soldiers a restorative or roborant, which, with a little wine, immediately revives their strength exhausted by great loss of blood, and enables them to bear the transport to the nearest hospital." Liebig, in his work *Chemistry of the Food*, remarks, "It appears to me to be a matter of conscience to recommend to the attention of governments the proposal of Parmentier. I consider this extract of flesh as not less valuable for provisioning of ships and fortresses in order to preserve the health of the crew or garrison, in those cases where fresh meat
